JX Step Sequencer — Update History

Ticco Ross

Every version of JX Step Sequencer and what it changed, newest first. Unless noted, changes apply to the VST3 and Audio Unit versions.

Version 1.0.16

Changed

- **Simpler transpose:** the TRN readout and its list are gone. The transpose amount now shows right after **KEY** on the display, in dim red (for example **KEY +5**). At 0 only KEY is shown.
- Set the transpose with your keyboard while KEY is on, or by automation and MIDI mapping.

New

- Double-click **KEY** to set the transpose back to 0.

Version 1.0.15

New

- **Transpose:** shift the whole sequence by up to ±24 semitones. Click **TRN** on the display and pick a value from the list. Your recorded notes are never changed.
- **Key transpose (KEY):** with KEY on and the sequence playing, the keys you press transpose the pattern live (C3 = original pitch).
- **Rest and Tie on a selected step:** with REC off, select a step and press Rest or Tie to change it.
- **Double-click zoom:** double-click the display to make the window 125% larger; double-click again to go back.
- **Store link:** click the green, blue and red stripes to visit the Ticco Ross store on Gumroad.

Improved

- Transpose and Key transpose can be automated and MIDI-mapped.
- The MIDI drag-out exports the sequence at the current transpose.

Version 1.0.14

New

- **Click to select:** click any step on the display to select it, as well as using the < and > buttons.

Version 1.0.12 and 1.0.13

Changed

- **HELP is off by default.** Turn on the hover help texts with the HELP button.
- **Chord steps are light yellow;** single-note steps stay amber, so chords are easy to spot.

Documentation

- New manual design with a cover, an introduction to the original 1983 sequencer, a numbered panel picture and a diagram of how sequences are built.

Version 1.0.11

New

- The version number is shown in the corner of the panel.

Versions 1.0.8 to 1.0.10

New

- **Audio Unit version (macOS):** loads as a MIDI FX in Logic Pro and MainStage, on the same track as your synth.
- **Windows and Linux:** the VST3 now also runs on Windows 64-bit and Linux 64-bit.
- The Mac installer installs both the VST3 and the Audio Unit.

Documentation

- The manual covers Logic Pro, Windows, Linux and the Max for Live version.

Version 1.0.7

New

- **MIDI mapping:** REC, PLAY, Rest, Tie, Clear, Previous step, Next step and Erase can be mapped to a MIDI controller, as well as Rate.
- The PDF manual is included with every download.

Version 1.0.6

New

- **Mac installer:** install with a standard macOS installer (.pkg) instead of copying files by hand.

Versions 1.0.1 to 1.0.5

The first VST3 version, based on the JX Step Sequencer Max for Live device.

- Polyphonic step sequencer: up to 128 steps and 6 notes per step, with Rest and Tie
- Synced to the host tempo and transport; the sequence is saved with your project
- **HELP** button for the hover help texts
- **MIDI** button: drag the sequence into your arrangement as a MIDI clip, or click to save a .mid file
- The green, blue and red stripes on the panel
- Published under the Ticco Ross name
